

Could There Be Life on Other Planets?

by Ty Pepe

Do you think life has ever existed somewhere else besides Earth? I do believe life has existed somewhere else, this somewhere is the planet Mars. The scientists have found no real living organisms there, but they have found things that can show signs of possible living conditions. Also, on Earth we received a meteor. This meteor was from the planet Mars. The meteor was different to most we have seen from this planet but this could be sign of something and this sign could be giving us more knowledge about this planet. I believe that there could be life on Mars because, resources such as water and clay is present and rocks from Mars support the theory.

Scientists have found things like water, clay and elements that could make conditions favorable for life to exist on other planets.. Also the scientists have found things like the right kind of climate for animals and people to live in. They may have come in contact with signals or voices. But even though researchers have found some signs of possible life it would still be hard to live there due to the planet's atmosphere and temperature. The temperature during the day is bearable, but it gets too cold as the day goes on. The water is also always freezing, so wildlife would have a hard time living there. During the time when Earth received gift from the planet which is planet with life on it they gave the planet Earth massive rock that is different then most we have seen and this massive rock is different because looks different because this one is

more of new rock and it seems to be more like rocks we see today and it was similar to one on Earth.

Although scientists have found no evidence of life on Mars, they have found evidence that can possibly lead up to it. Also scientists have found some signs that can lead to survival for things like microbes and small things you can't see. Also they have found elements which can also help lead to living things, but the temperature has changed. Even though conditions may be possibly too cold there is still chance they may find life with real evidence one day in the near future.

The chances something would be able to live on this planet is hard, but there is a chance because the water contains oxygen. Even though the planet has had no definite evidence of life, yet scientists once thought they heard voices coming from planet, and it sounded like it was talking about sports. The voice was talking about a football game, and the NASA scientists thought it had to be some kind of animal which was once living on earth. They may be able to find out what that animal it was one day.

The planet has had no real evidence found of living things yet, yet they have still found living conditions or things to keep you alive. That means there is still a chance that living things may exist on Mars. Perhaps as technology continues to grow, more research can be done. Maybe scientists will even figure out a way to help life grow on Mars if it's not already there.
